Problem Statement

Many people who have illnesses find it hard to buy medicines because some pharmacies are far away or always crowded. Others cannot get their medicines on time because the drug they need is out of stock. This problem mostly affects elderly people and those with health conditions who cannot travel easily. When medicines are delayed, it can cause serious health problems. That's why there is a need for an easier way to buy medicines.

Solution Overview

An online medicine application allows users to order their medicines anytime using their phone or computer. The app lets them search for the medicine they need, upload their doctor's prescription, and have the medicine delivered to their doorstep. This makes buying medicines faster, easier, and more organized. It helps users manage their health better without leaving home.

Community Benefit

This application helps make healthcare more accessible to everyone mostly to eldery people, people who have strong illnesses and especially for people living in remote areas. It saves time, effort, and money by reducing the need to travel to pharmacies. The app also ensures patients get their medicines on time, leading to better health and safety. It can help reduce the spread of illness by avoiding crowded places. Overall, it supports a healthier and more convenient community.
